Symulacja i analiza rozkładów cząstek pp @ $\sqrt{s} = 13.6$ TeV

Konstanty Sobczyński

Ustawienia symulacji

- Pythia 8.312, ROOT 6.40.02
- zderzenia pp, `Beams:eCM = 13600` GeV
- *minimum bias*: `SoftQCD:inelastic = on`
- 100 000 zderzeń, seed 123456
- analizowane wyłącznie cząstki stanu końcowego (`isFinal()`)

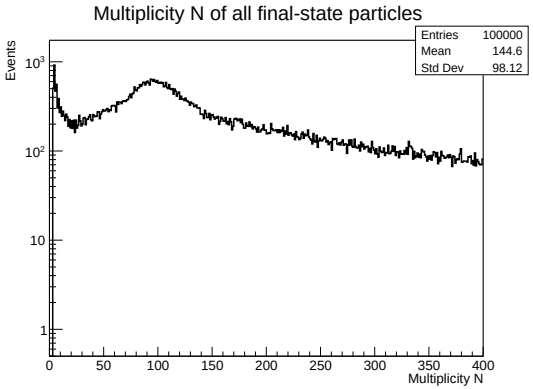

Łańcuch analizy

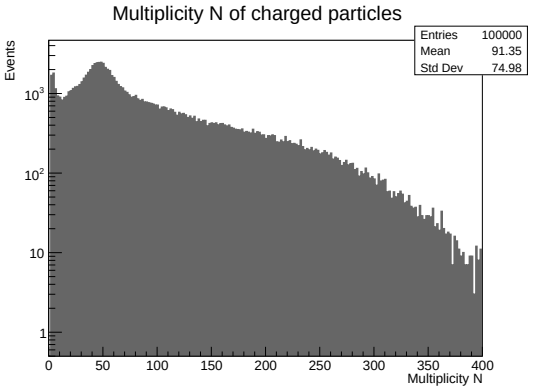

`generate` → `events.root` → `analysis` → `analysis.root` → `draw_plots.C` → wykresy

kategoria	wybór
all	wszystkie stanu końcowego
ch	ładunek $\neq 0$
$\pi^{\pm}$	PDG ± 211
$K^{\pm}$	PDG ± 321
$p,\ \bar{p}$	PDG ± 2212

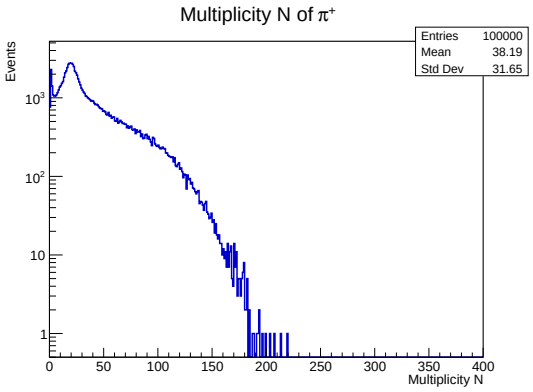

wielkość	zakres	biny
N	0–400	400
p_T	0–10 GeV	100
η	-5–5	100
ϕ	0–π	64

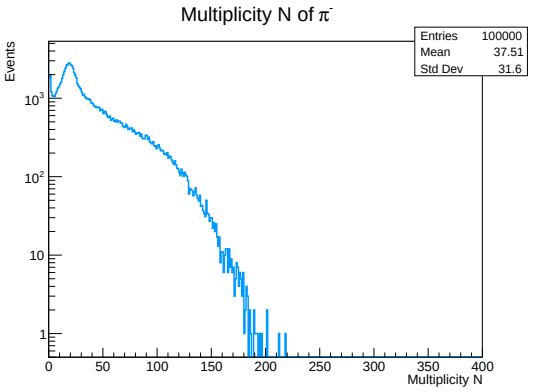

Krotność N: wszystkie i naładowane

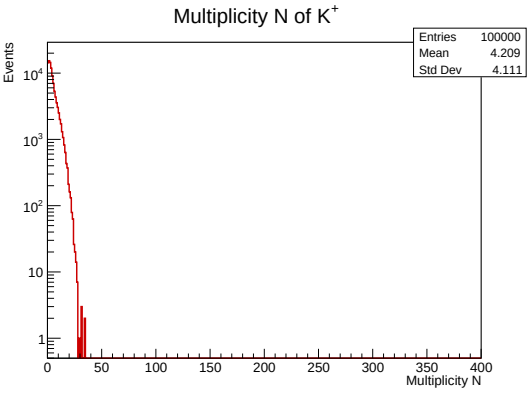

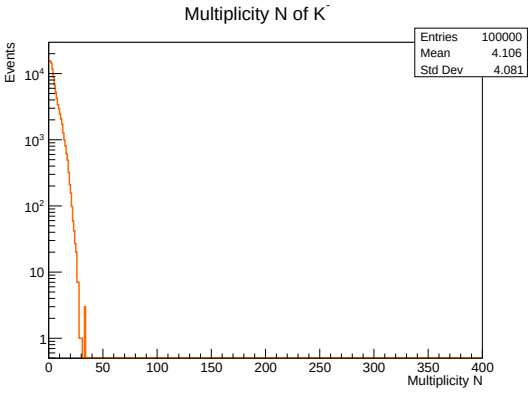

Krotność N: piony

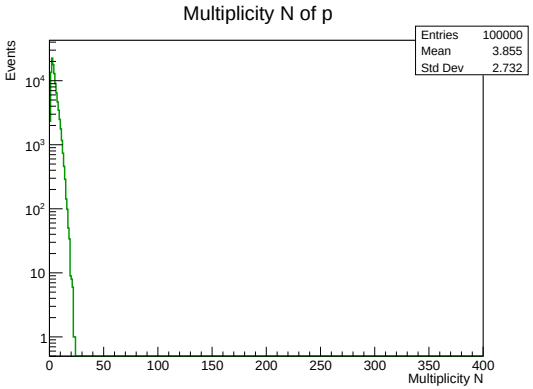

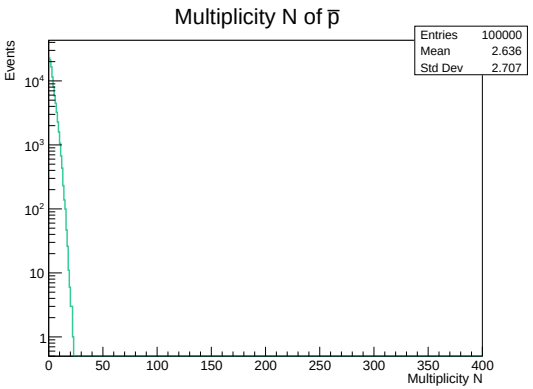

Krotność N: kaony

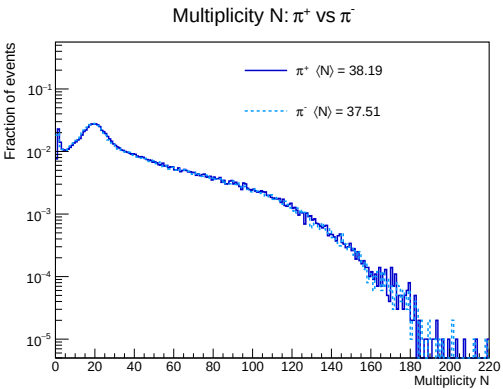

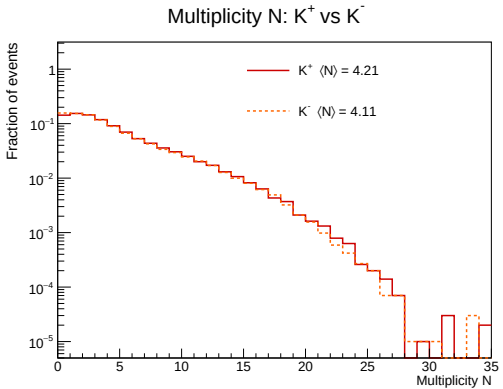

Krotność N: protony

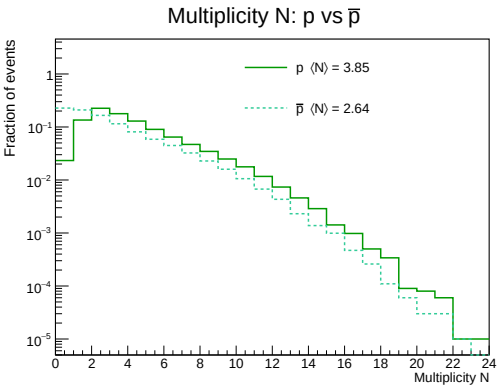

Krotność N: porównania

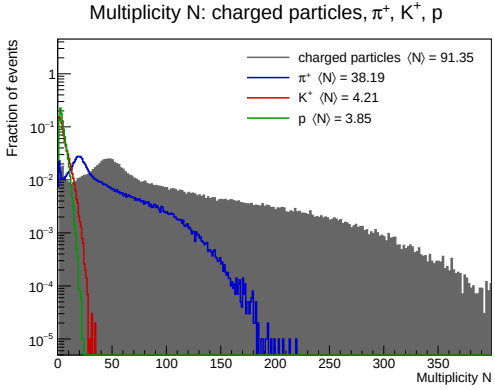

Histogramy podzielone przez liczbę zderzeń.

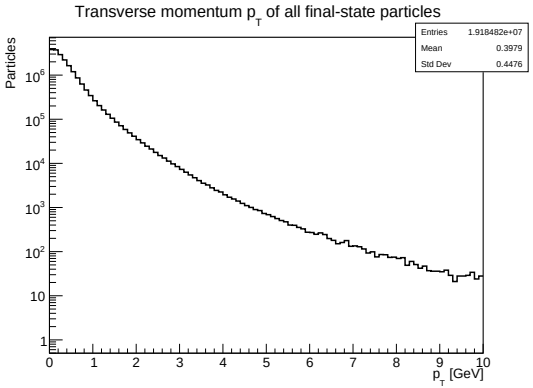

Krotność N: porównania

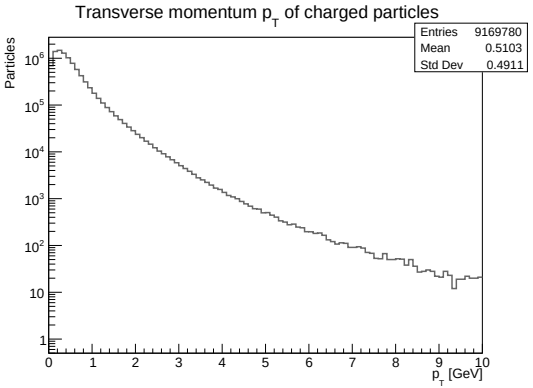

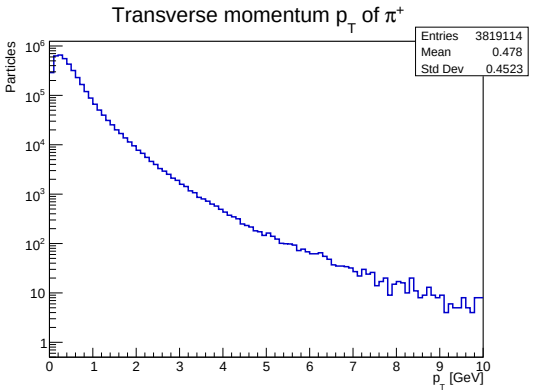

Histogramy podzielone przez liczbę zderzeń.

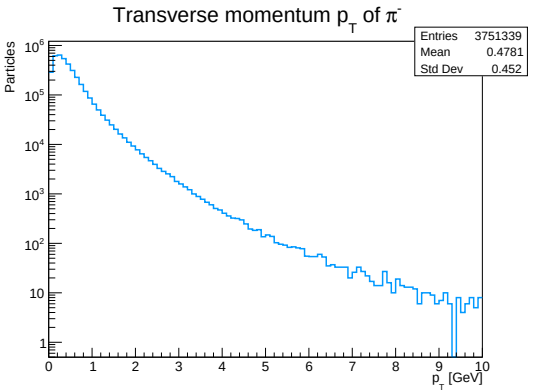

Pęd poprzeczny p_T: wszystkie i naładowane

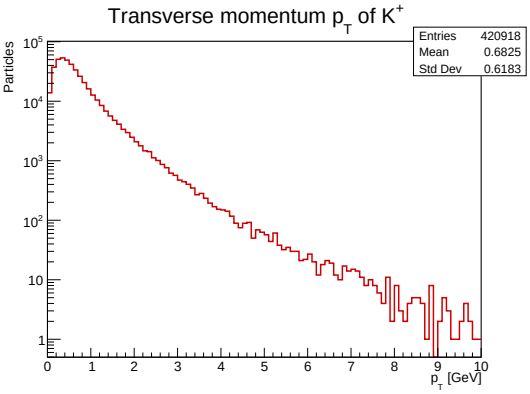

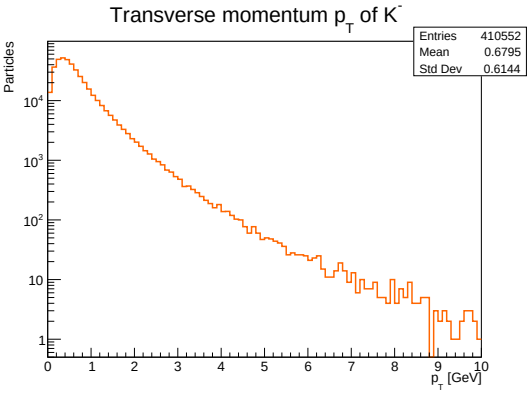

Pęd poprzeczny p_T: piony

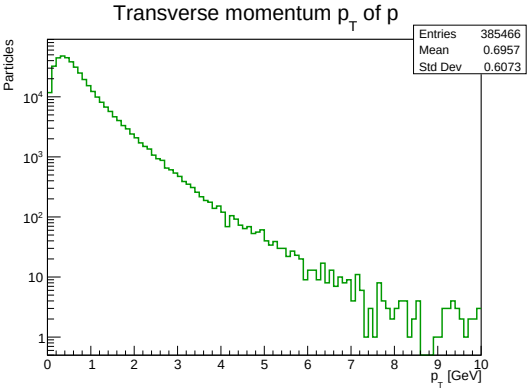

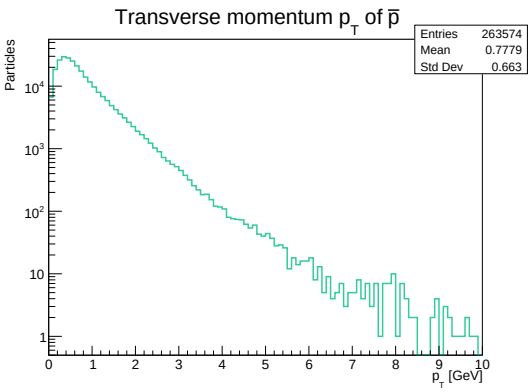

Pęd poprzeczny p_T: kaony

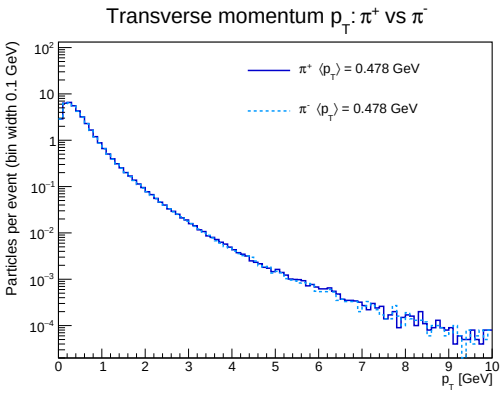

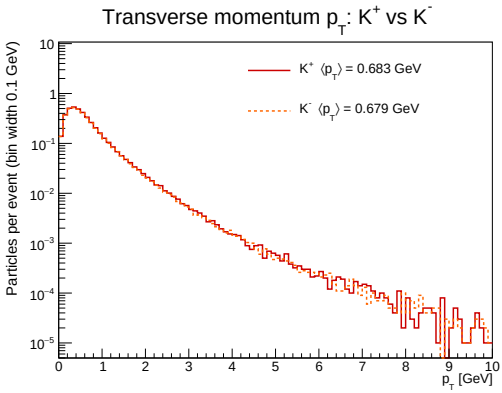

Pęd poprzeczny p_T: protony

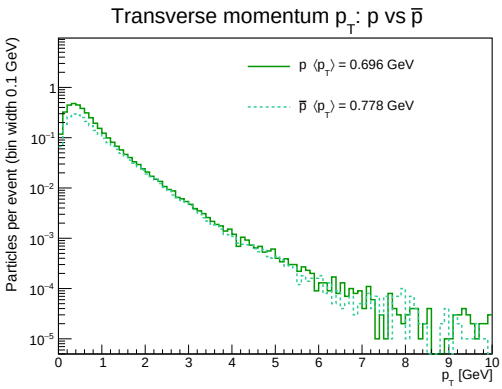

Pęd poprzeczny p_T: porównania

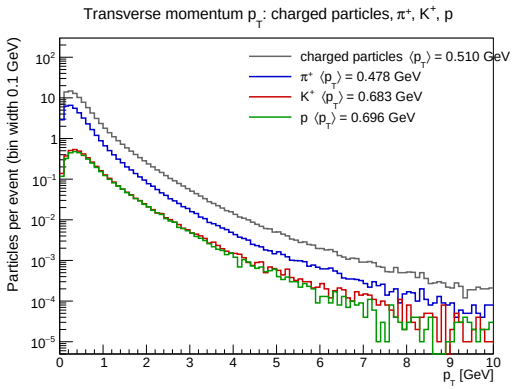

Histogramy podzielone przez liczbę zderzeń.

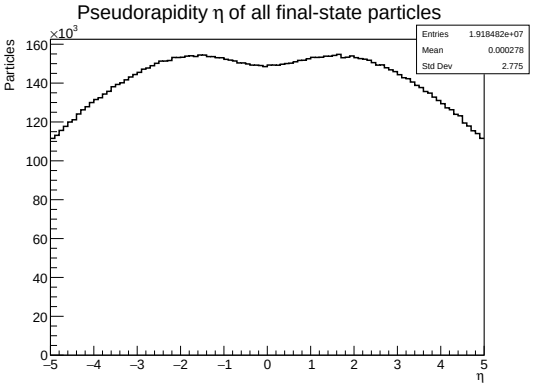

Pęd poprzeczny p_T: porównania

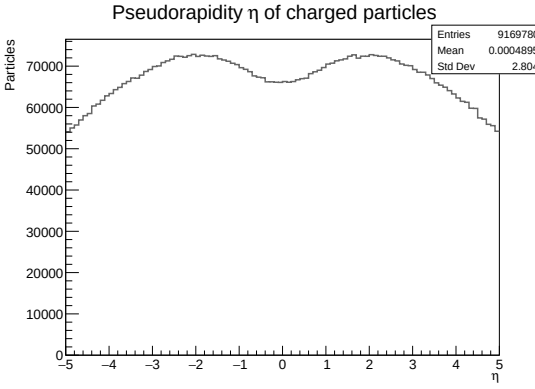

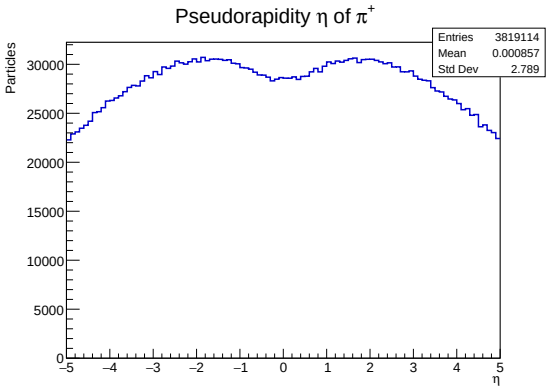

Histogramy podzielone przez liczbę zderzeń.

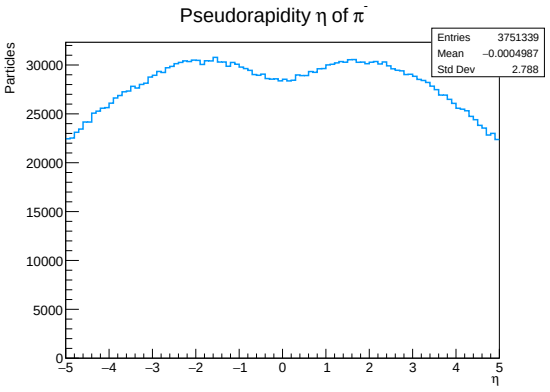

Pseudorapidity η: wszystkie i naładowane

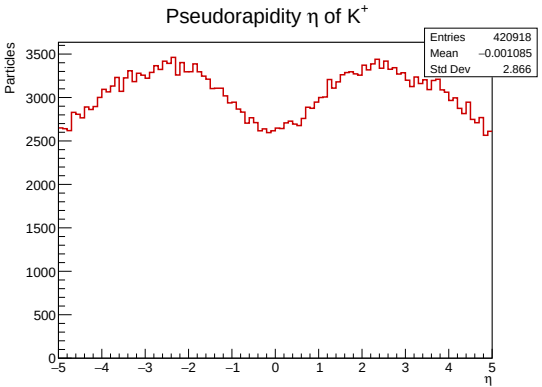

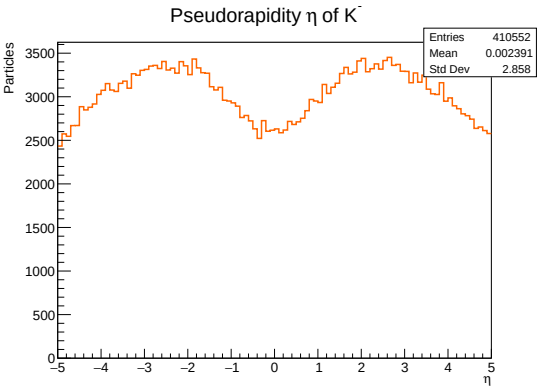

Pseudorapidity η: piony

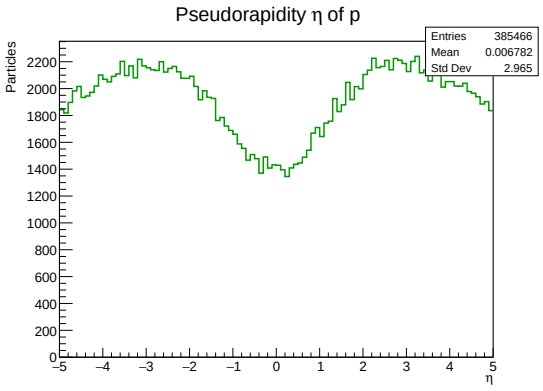

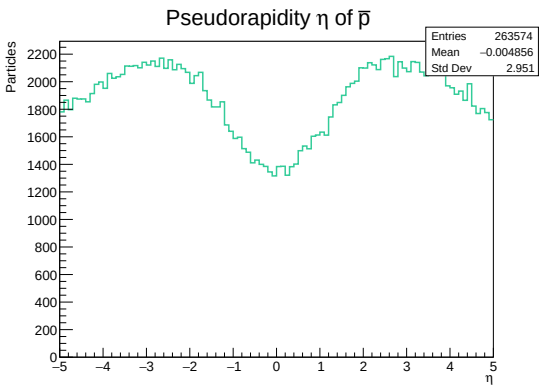

Pseudorapidity η: kaony

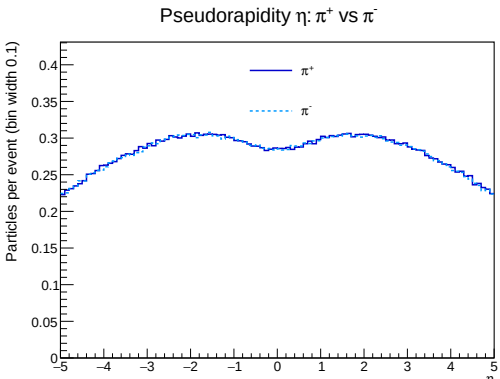

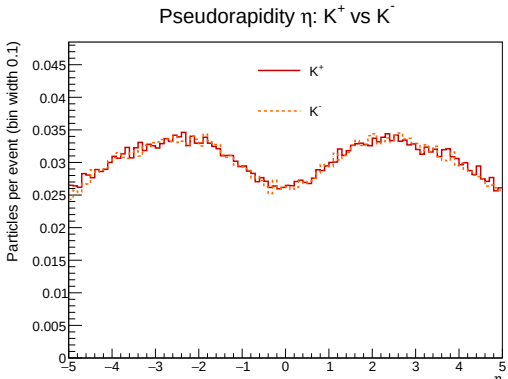

Pseudorapidity η: protony

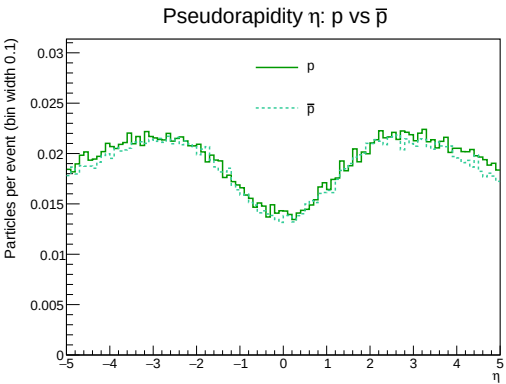

Pseudorapidity η: porównania

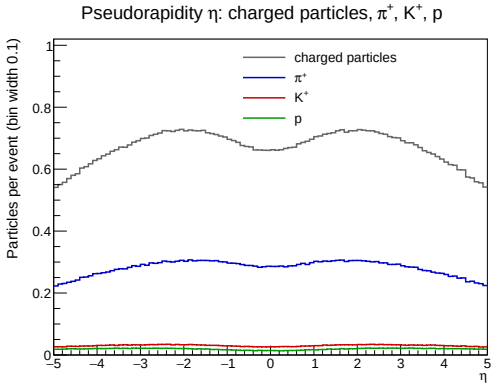

Histogramy podzielone przez liczbę zderzeń.

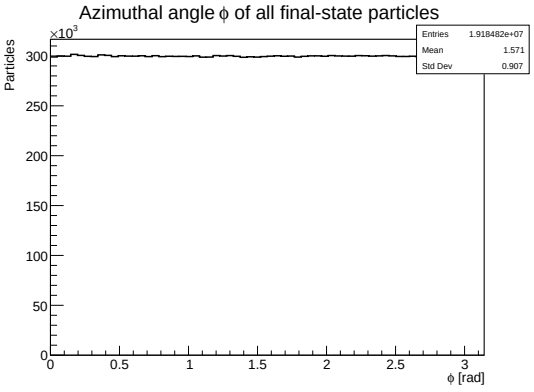

Pseudorapidity η: porównania

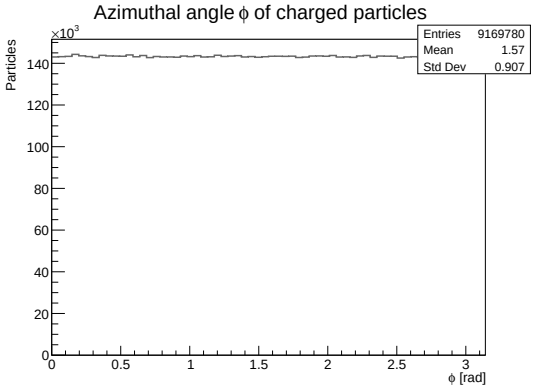

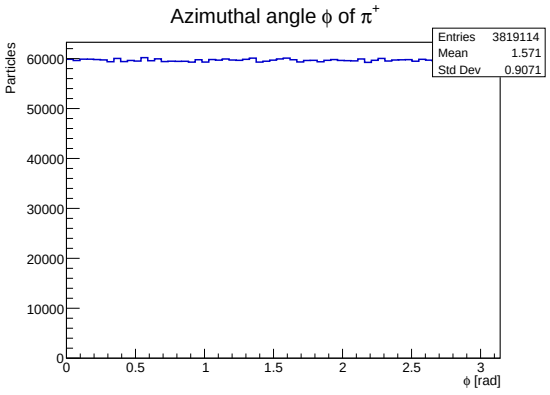

Histogramy podzielone przez liczbę zderzeń.

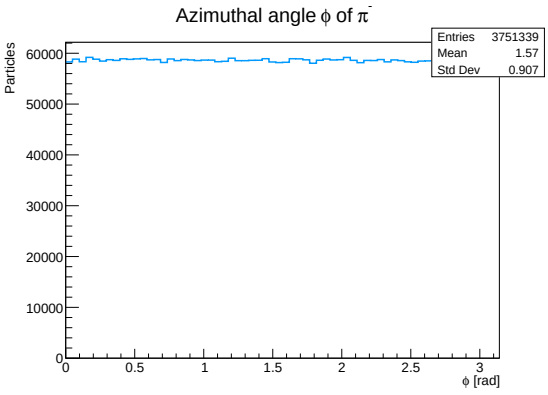

Kąt azymutalny ϕ: wszystkie i naładowane

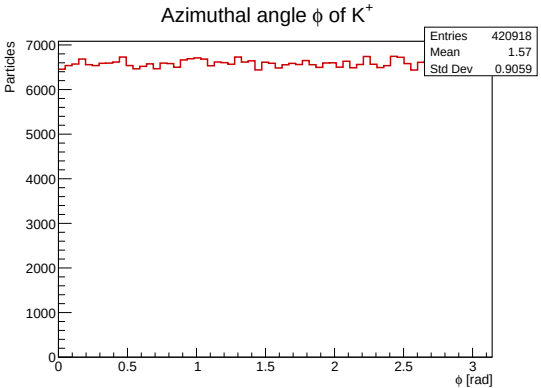

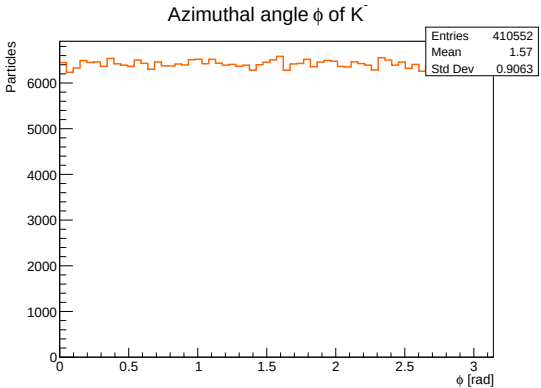

Kąt azymutalny ϕ: piony

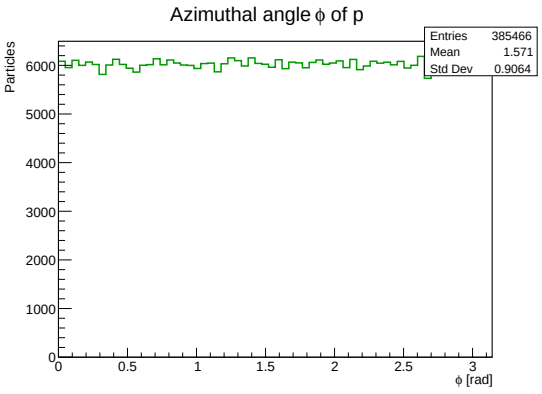

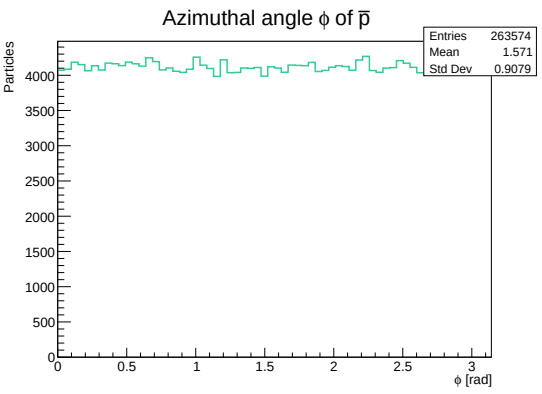

Kąt azymutalny ϕ: kaony

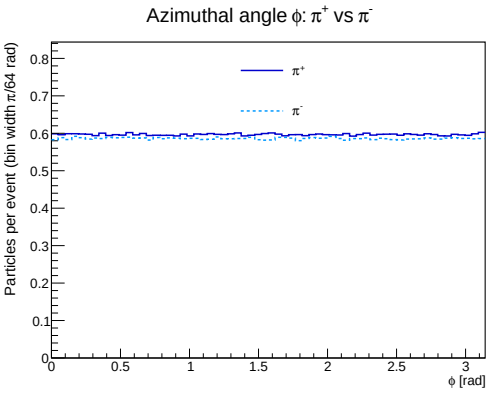

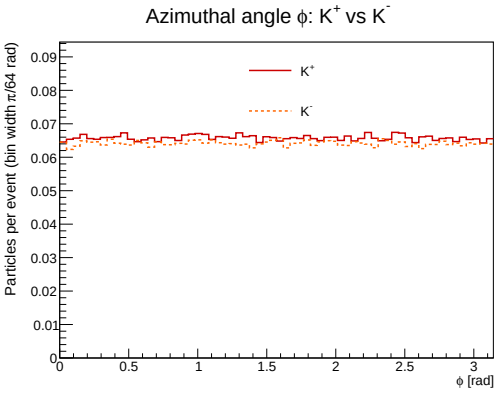

Kąt azymutalny ϕ: protony

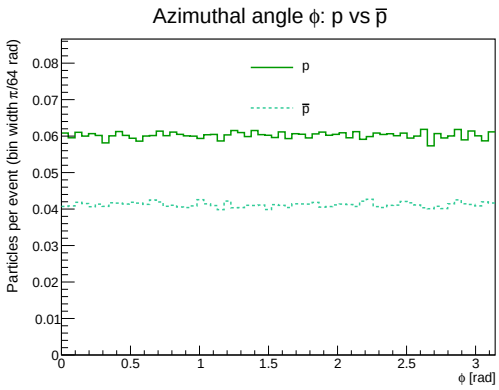

Kąt azymutalny ϕ: porównania

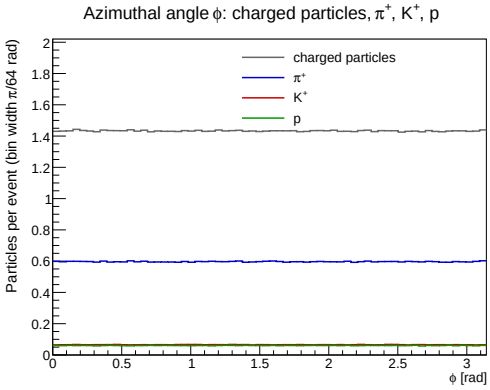

Histogramy podzielone przez liczbę zderzeń.

Kąt azymutalny ϕ: porównania

Histogramy podzielone przez liczbę zderzeń.

Podsumowanie liczbowe

kategoria	$\langle N \rangle$ na zderzenie	$\langle p_T \rangle$ [GeV]
wszystkie stanu końcowego	191.9	0.398
naładowane	91.7	0.510
π^+ / π^-	38.19 / 37.51	0.478 / 0.478
K^+ / K^-	4.21 / 4.11	0.683 / 0.679
p / $\bar{p}$	3.85 / 2.64	0.696 / 0.778
